get any
better
than this

HIGH FLOW DESIGN

**FACTORY LUBED FOR
LONG LIFE**

**EXACT O.E. FIT FOR
FAST, EASY INSTALLATION**

Built by GMB, one of the world's largest automotive product manufacturers, these precision built pumps meet or exceed original equipment (O.E.) specifications. Heavy duty steel bearings are sealed and lubed for life. Unitized seals ensure leak-free performance. All are factory tested for assured quality.

Performance Series

High performance impeller eliminates cavitation at all RPM's

Precision ground, heavy duty steel bearing that's completely sealed and lubed for life

Up to 300% increase in pump pressure

Larger internal passages for maximum coolant flow

Added material in critical stress areas for long life

Water Pumps built to beat the heat

GMB Performance Series Water Pumps are designed and built to combat engine overheating associated with higher performance and load applications.

GMB High Performance Water Pumps feature a precision ground, heavy duty steel bearing that's completely sealed and lubed for life. A specially modified, high performance impeller eliminates cavitation at all RPM's, and maintains maximum volumetric flow of coolant throughout the engine.

Additional features of GMB Performance Series Water Pumps are:

- Increase pump pressure up to 300%
- Eliminates steam pockets trapped inside the engine block
- Reduces engine temperature by 15-30 degrees
- Increase horsepower

Incredibly efficient. Built to survive. Features every performance enthusiast can appreciate. GMB, the clear choice for true high performance water pumps.

For **Performance Series Water Pump** applications, refer to catalog under vehicle listing, then, using the chart below, cross reference the **Standard Pump** part number to the **Performance Pump** part number.

New GMB Water Pumps & Fan Clutches

NEW VS. REBUILT WATER PUMPS

The most obvious reason for installing a new GMB water pump is the precision matched manufacturing of every component. GMB water pumps far exceed the quality and performance of the original equipment. That's because GMB engineers, working from OE manufacturer blueprints and sample parts, design GMB water pumps for optimum performance to exceed the life and performance of original equipment. GMB water pumps use superior alloy materials and state-of-the-art manufacturing techniques that guarantee unparalleled precision and superlative operation for the life of your vehicle. That's why, when you choose a GMB water pump, you can be sure it's the last one you'll ever buy for your vehicle. For the money, some people believe that a rebuilt factory water pump is a vehicle alternative to a new GMB replacement water pump. Not True! Think about it. A rebuilt water pump started life as a plain old, OEM pump. It's been rebuilt because it's worn out! In the rebuilding process, many of the old components considered still serviceable are reused. At best, it's a gamble.

Considering the time and expense of installing a replacement water pump, it just makes good sense to insure that it's the last time you'll ever have to do it. The no risk, GMB water pumps can't be beat.

Cooling System Overview

Radiator

The radiator is responsible for transferal of heat from the circulating coolant to the air passing through it. Heated coolant flows into the top of the radiator from the engine. The coolant is passed through a series of tubes and fins that effectively dissipate the heat in the coolant.

Radiator Cap

Modern radiator caps are actually pressure valves that are responsible for increasing and regulating pressure in the coolant system. Increasing the coolant system pressure raises the boiling point of the coolant. For every additional pound of atmospheric pressure the coolant boiling point increases 3 deg. F.

How to tell if a water pump is defective

1. Check for shaft seal failure by carefully inspecting the water pump weep hole. When a water pump is new, some seepage is normal in the initial hours of operation as the seal seats. Other than that, any leakage that occurs is due to seal failure and the pump needs replacement. There may be tell tale trails of rust, calcium and coolant deposits on the water pump housing with the weep hole as the origin.

2. Detect a worn water pump bearing by checking for side-to-side play at the shaft. There should be no perceptible play as you apply hand pressure to the shaft. Accelerated bearing wear is characterized by screeching or rumbling noises coming from the water pump housing. If any of these conditions exist, the bearing is worn out and the pump should be replaced.

How to tell if a fan clutch is defective

1. Check for oil streaks (or dust collected on oil streaks) on the fan clutch. It's a sure sign that the internal fluid that provides the clutch action is leaking.

2. To check for a worn bearing, grasp the fan blade on either end, with the engine off, and check for lateral movement. If there is more than 1/4" of side-to-side movement, the bearing is worn and the unit needs replacement.

3. In checking for proper fan clutch operation, first run the engine until operating temperature is reached. Next, with the engine off, give the fan blade a gentle spin. If it rotates more than twice the clutch is worn and needs replacing. If fan rotation is rough or noisy, or the fan fails to turn, the unit is worn out and needs replacement.

Coolant

Coolant, flowing through the hot engine, transfers the heat to itself for dissipation in the radiator. In addition to providing improved performance over plain tap water, most leading anti-freeze products contain anti-rust and corrosion additives that prevent sediment build-up and premature cooling system component failure.

Coolant Recovery Tank

The coolant recovery tank serves as a reservoir. It receives coolant expelled from the cooling system through the pressure valve in the radiator cap. It holds the expelled coolant for reintroduction into the cooling system when needed. When additional coolant is needed in the system, it should be added to the recovery tank, not directly to the radiator.

Fan

The fan pulls cool air through the radiator to aid heat-transfer from the coolant.

Fan Clutch

The fan clutch is designed to keep the optimum amount of air flowing through the radiator. At slow vehicle speeds, the fan is

required to move enough air through the radiator to insure proper cooling. At highway speeds the airflow through the radiator is sufficient to provide proper cooling without the aid of the fan. The clutch lets the fan free wheel at highway speeds, reducing horsepower loss.

Belts

The belts are responsible for driving the water pump, as well as other accessories. Be sure they are in good shape and adjustment, not worn, cracked or slipping. Never over tighten belts. Over tightened belts put unnecessary side-load pressures on the water pump impeller shaft and bearings. Premature water pump failure is inevitable.

Hoses

Radiator hoses are responsible for carrying coolant to and from the engine from the radiator. They should be regularly checked for signs of advanced deterioration, such as bulging and cracking. Healthy hoses should be pliable. Not soft and spongy, or hard and brittle. Any sign of leakage could mean its time for replacement.

Thermostat

The thermostat is responsible for regulating the flow of coolant into the engine block. It keeps the engine block at its optimum operating temperature. When the engine is cold, the thermostat closes to restrict coolant flow and allow the engine to quickly reach a satisfactory operating temperature. As the engine heats up, the thermostat opens and allows more coolant to circulate. A sticky thermostat can stop or restrict coolant flow to the engine.

Water Pump

The water pump delivers a continuous flow of coolant through the radiator and through the engine. A paddle style impeller mounted inside the water pump housing, rotating on a bearing supported shaft, is responsible for moving the coolant. The impeller shaft is driven externally by a pulley/belt combination that's connected to the crankshaft pulley. Keeping the coolant clean and fresh and the belts properly tensioned is about all the maintenance the water pump requires.

Common Water Pump Failures and Their Causes

Figure 1

BROKEN WATER PUMP HOUSINGS AND SHAFTS COMMONLY CAUSED BY:

(FIGURES 1 & 2)

Excessive Vibration & Unbalance due to:

- Bent, Cracked or Broken Fan
- Fan not squarely mounted on the shaft
- Cracked or Bent Pulleys due to improper handling or installation.

Belts Too Tight

- Over tightened belts cause over loads on the bearing, greatly reducing its operating life
- They also impose a powerful bending force on the shaft causing it to deflect substantially from true center rotation. The result is large unbalanced and early fracture

Figure 2

SEEPAGE FROM THE WEEP HOLE

(FIGURE 3)

Seepage from the weep hole is a sure sign of seal failure. The life of the seal can be greatly extended by performing regular maintenance on your cooling system. Periodic inspection of hoses and coolant recovery tank will assure coolant levels are correct and that no atmospheric contaminant's that can cause oxidation and sludge build-up are present. Sludge build-up in the cooling system is a primary cause of seal failure as well as reduced cooling system efficiency.

Figure 3

NEW WATER PUMP

INSTALLATION INSTRUCTIONS:

Heavy duty water pump designed and manufactured for maximum Performance featuring:

Precision ground steel heavy duty bearing sealed and lubed for life.

Unitized seal for maximum protection against leaking.

Vertical breather located under hub, replaces conventional weep hole on some water pumps.

To insure best results, follow these step-by-step instructions:

- | | | | |
|----------|--|-----------|--|
| 1 | Flush cooling system of all sediment, rust & scale before removing old water pump. | 10 | Check fan blades. If bent, cracked or rivets are loose, replace entire fan. Do not try to straighten. |
| 2 | Disconnect fan, fan clutch, hoses and fan belts. | 11 | If equipped with fan clutch, check fan clutch for loss of oil, looseness or wobble. Replace if damaged. |
| 3 | Remove old water pump, clean impeller cavity in engine block & clean gasket surface | 12 | Install fan clutch. Check that it sits flat on pump hub. Use lock washers & torque bolts evenly for wobble free operation. |
| 4 | Tighten steel back plate bolts on water pump where applicable. | 13 | Tighten fan belts to factory recommended tension. Use a commercial tension gauge or adjust belt movement from $\frac{1}{2}$ " to $\frac{3}{4}$ " as recommended. |
| 5 | Coat new gaskets on both sides with sealer and position on pump or engine block. | 14 | Check fan clearance at blade tip between shroud and radiator. |
| 6 | Install new water pump. DO NOT STRIKE SHAFT. This can damage bearings. Tighten bolts evenly in crossing pattern. | 15 | Start engine and run until operating temperature is reached. Check for leaks and smooth operation. |
| 7 | Turn pumps shaft by hand for free rotation. | 16 | Shut off engine, let cool, remove radiator cap and top off radiator coolant. |
| 8 | Reinstall hoses & belts. Be sure belt & pulley line up. | | |
| 9 | Fill radiator with fresh coolant and check for leaks. | | |

NEW FAN CLUTCH

INSTALLATION INSTRUCTIONS:

Heavy duty water pump designed and manufactured for maximum Performance featuring:

PROVIDES:

- Increased Cooling
- Increased Fuel Economy
- Increased Horse Power

To insure best results, follow these step-by-step instructions:

- | | |
|----------|--|
| 1 | Flush cooling system of all sediment, rust & scale. |
| 2 | Remove fan, fan clutch and fan belts. Check fan blade. If bent, cracked or rivets are loose, replace entire fan. Do not try to straighten. |
| 3 | Check water pump for leaks or wear. Replace if necessary. |
| 4 | Mount fan blade squarely on fan clutch and tighten to 15 lbs. of torque. |
| 5 | Install fan clutch. Check that it sits flat on water pump hub. Use lock washers and tighten to 15 lbs. of torque. Check for wobble free operation and clearance of blade tip between shroud and radiator. |
| 6 | Install fan belts. Be sure belt and pulley line up. Tighten fan belts to factory recommended tension. Use a commercial tension gauge or adjust belt movement from $\frac{1}{2}$ " to $\frac{3}{4}$ " as recommended. |
| 7 | Fill radiator with fresh coolant and check for leaks. |
| 8 | Start engine and run until operating temperature is reached. Check for smooth operation. |
| 9 | Shut off engine, let cool, remove radiator cap and top off radiator coolant. |
